

Palaeozoic Palaeogeography and Biogeography

Geological Society Memoir No. 12

W. S. McKerrow & C. R. Scotese (Editors)

In the Palaeozoic Era, the best evidence for estimating the positions of continents and oceans comes from palaeomagnetism and from the geographical distribution of fossils. This memoir contains contributions from eminent palaeomagnetists and palaeontologists from America, Asia, Australasia and Europe. The information presented includes the most recent palaeomagnetic and biogeographic data from all major Palaeozoic continents. From this information, a new set of world maps has been produced illustrating successive positions of the continents and oceans throughout the Palaeozoic Era.

... an excellent source of up-to-date information for those already involved with the Palaeozoic world and the best book to start with if you are visiting there for the first time ...

Jane Francis in *Australian Geologist*, No. 77, p42

... a book that anyone with an interest in Palaeozoic palaeogeography and palaeobiogeography will want to own.

Reed Wicander in *AASP Newsletter*, Vol. 26, No. 3

... an essential reference for the palaeogeography of the Palaeozoic.
